P24 Guardian approval reviewer

Primitive · A² A2 · guard role collaboration

Review risky proposed actions.

STRUCTURE · PARTICIPANT COLLABORATION

PATTERN INTERFACE

context

A proposed tool action is classified as requiring review.

trigger

Policy requests approval or an automated reviewer detects risk.

structure

Review request, reviewer context, decision reason, and approve/reject/escalate path.

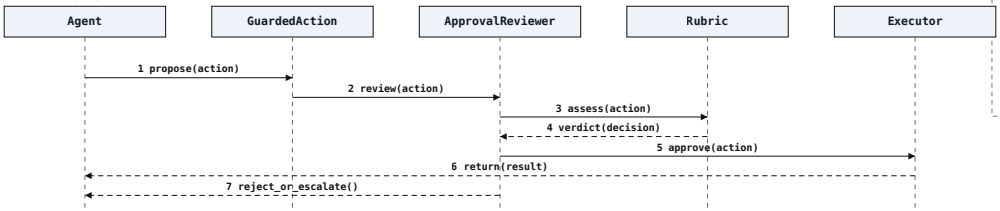

effect

The action waits for and executes only after an accepted decision.

CONTRACT ANNOTATIONS

requires	Proposed action identity, risk context, and authority source are available.
ensures	The approval binds to the exact action and records the decision.
invariant	Review cannot silently execute while pending or accept a different action.
violation	Timeout, reviewer failure, or rejection blocks execution with a typed outcome.

INTERACTION

MESSAGE TRACE `1 propose(action) → 2 review(action) → 3 assess(action) → 4 verdict(decision) → 5 approve(action) → 6 return(result) → 7 reject_or_escalate()`

Evidence: 23/41 repositories, 22/36 families; 23 trajectories (14 multi-checkpoint); exact audit: not sampled.

Variation: Human prompt, reviewer agent, policy guardian, callback, and resumable interruption.

Negative control: A post-hoc warning after execution is not an approval gate.
